INVENTING the FUTURE

North Coast Industrial Imaging was founded to support the imaging needs of the industrial community. While our major emphasis and expertise is in the area of thermal imaging, we also have experience—and experienced partners—in the fields of x-ray imaging and vision systems.

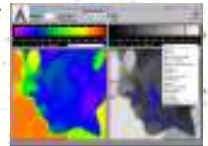

Hardware

From low-cost / low-resolution imaging products to high density pixel thermal imaging devices, NCII can deliver products to meet your specific business applications and needs. We represent several manufacturers, and can offer handheld, fixed mount, and convertible imaging solutions.

Software

In addition to our standard imaging products, we offer applications to support predictive technologies and customized software design services to meet any industrial imaging application.

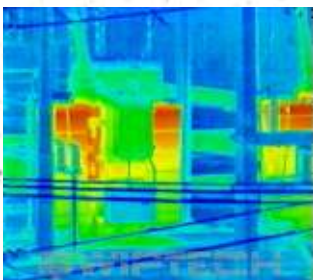

Predictive Technologies

The NCII Predictive Technologies practice offers skilled trained resources to supplement your internal programs, as well as program management to assist in implementing new programs / projects.

Training

In addition to selling a broad line of standard imaging products, NCII has the expertise and resources to deliver training (and one-on-one mentoring) to your in-house team. We can offer training in general thermography principals to support certification efforts, or training in specific uses of thermal imaging such as electrical audits, roof surveys, or injection molding cooling audits. Please contact us to discuss your specific applications and our technical team will contact you to offer potential solutions.
